RAPPORT D'ANALYSE

Comparative Analysis Report

Rapport généré automatiquement

Objet : Comparative Analysis Report

Organisme : Ministère de l'Habitat

Date de génération : 09/08/2026 16:35

SOMMAIRE

Ce rapport est organisé selon les sections suivantes :

• 1. Objet de la demande

• 2. Résumé et analyse

• 3. Requête SQL exécutée

• 4. Méthodologie

• 5. Conclusion

• 6. Résultats SQL

• 7. Visualisations

• 8. Conclusion

INFORMATIONS DU RAPPORT

Cette page présente les principales informations relatives au rapport généré automatiquement par la Plateforme IA d'Analyse du Secteur Immobilier.

Champ	Valeur
Titre du rapport	Comparative Analysis Report
Sous-titre	Rapport généré automatiquement
Auteur	Ministère de l'Habitat
Date de génération	09/08/2026 16:35
Nombre de sections	4
Nombre de tableaux	1
Nombre de graphiques	1
Lignes SQL	15
Colonnes SQL	5
Source des données	SQL Server - Ministère de l'Habitat
Généré par	Plateforme IA d'Analyse du Secteur Immobilier

Les informations ci-dessus sont générées automatiquement au moment de la création du rapport. Elles permettent d'assurer la traçabilité du document et de faciliter son exploitation dans un contexte institutionnel.

1. Objet de la demande

Fais un rapport sur les prix des matériaux

Indicateurs clés

Résultats	Minimum	Maximum
10000 lignes	0,61	10 800,00
Nombre de lignes retournées par la requête	Valeur minimale de PrixMoyen	Valeur maximale de PrixMoyen

Moyenne	Médiane
417,09	40,38
Moyenne de PrixMoyen	Médiane de PrixMoyen

2. Résumé et analyse

Executive Summary This report analyzes material price data across regions, provinces, materials, and years. The dataset contains 10,000 records spanning 2005 to 2019, with substantial variability in average prices. Key statistics indicate a wide distribution of PrixMoyen, suggesting material prices vary considerably by region, province, and material type. The analysis recommends visualization to reveal geographic and temporal patterns and to support data-driven decisions. # Objective - Assess the distribution and central tendencies of material prices (PrixMoyen) across regions, provinces, materials, and years. - Identify the range and variability of prices over the observed period. - Provide visualization and actionable recommendations grounded in the supplied data. # Dataset Overview - Records: 10,000 - Columns: Region, Province, Materiau, Annee, PrixMoyen - Temporal coverage: Annee ranges from 2005 to 2019 - Price coverage: PrixMoyen ranges from 0.61 to 10800.0 - Data characteristics: Categorical dimensions (Region, Province,

Materiau) with a numeric numeric field PrixMoyen and a numeric year field Annee Key statistical indicators (selected): - Annee: - minimum: 2005.0 - maximum: 2019.0 - average: 2011.93 - median: 2012.0 - std dev: 4.36 - PrixMoyen: - minimum: 0.61 - maximum: 10800.0 - average: 417.09 - median: 40.39 - std dev: 1482.48 # Methodology - The report is generated from SQL query results and subsequent statistical analysis applied to the provided dataset. - Descriptive statistics were computed for numerical fields (Annee, PrixMoyen), accompanied by distributional characteristics to understand central tendency and variability. - The analysis focuses on observable ranges and dispersion; no extrapolations beyond the data are performed. # Statistical Analysis - Temporal span: Annee demonstrates a broad range (2005–2019) with a mean just above 2012, indicating a mid-point in the observed period. - Price dispersion: PrixMoyen exhibits a very wide range (0.61 to 10800.0) and a high standard deviation (≈1482.48), relative to its mean (≈417.09) and median (≈40.39). This indicates substantial variability in material prices across records. - Central tendency vs. dispersion: The large difference between the mean and median price (mean ≈ 417.09 vs. median ≈ 40.39) suggests a right-skewed distribution with a minority of very high-priced observations influencing the average. - Data scope: With 10,000 rows, the statistics reflect a sizable dataset across multiple regions, provinces, and materials, though the exact breakdown by category is not provided in the summary. # Key Findings - The dataset covers 2005–2019, allowing assessment of price evolution over a substantial period, though no explicit year-over-year trend is presented in the statistics. - PrixMoyen shows high variability and potential outliers, as indicated by the large standard deviation relative to the mean and a substantial gap between mean and median. - Price levels are highly dispersed, implying material prices differ notably by region, province, and material, as well as by year, though specific subgroup analyses are not included in the provided statistics. # Recommended Visualizations - Map visualization: - Type: Map - Title: Map for material prices by region - X-axis: Region - Y-axis: Annee - Rationale: Geographic distribution is indicated by the presence of Region and Province fields; mapping can reveal regional price patterns. - Bar chart: - Type: Bar - Title: Bar for material prices by Region - X-axis: Region - Y-axis: Annee - Rationale: Visualizes distribution of price ranges across regions and facilitates comparison. - Scatter plot: - Type: Scatter - Title: Scatter of material prices by Region over Years - X-axis: Region - Y-axis: Annee - Rationale: Useful to explore potential relationships between region and year in price data, given multiple numeric columns exist. # Business Recommendations - Investigate price dispersion drivers: - Given the high variability in PrixMoyen, conduct subgroup analyses (by Region, Province, and Materiau) to identify specific clusters with consistently high or low prices. - Regional pricing strategies: - Use geographic visualizations to target regional pricing adjustments, supply planning, or procurement strategies where prices show pronounced regional differences. - Material-level considerations: - Analyze by Materiau to determine if certain materials exhibit greater volatility or seasonality, informing contracting and inventory strategies. - Data quality and deeper analysis: - Consider adding subgroup statistics (by Region/Province/Materiau) to quantify variability within each segment and to support more precise forecasting. - Monitoring and governance: -

Establish periodic updates of PrixMoyen and Annee distributions to track price dynamics over time and detect anomalies promptly. # Conclusion The analysis reveals substantial variability in material prices across the dataset, underscored by a wide PrixMoyen range and a high standard deviation. While the temporal range is broad (2005–2019), explicit year-over-year or category-specific trends are not provided in the summary statistics. The recommended visualizations and analyses focus on geographic and material-level dispersion to support informed procurement, pricing, and planning decisions based on the supplied data.

3. Requête SQL exécutée

SELECT r.nom_region AS Region, p.nom_province AS Province, m.nom AS Materiau, f.annee AS Annee, AVG(f.prix_moyen) AS PrixMoyen FROM FACT_PRIX_INDICES AS f INNER JOIN REGION AS r ON f.id_region = r.id_region INNER JOIN PROVINCE_PREFECTURE AS p ON f.id_province = p.id_province INNER JOIN NIVEAU_MATERIAU AS m ON f.id_niveau_mat = m.id GROUP BY r.nom_region, p.nom_province, m.nom, f.annee ORDER BY r.nom_region, p.nom_province, f.annee

4. Méthodologie

Ce rapport est généré automatiquement à partir des données disponibles dans la base de données du Ministère. La question formulée en langage naturel est interprétée par l'agent d'intelligence artificielle, puis transformée en requête SQL. Les résultats retournés sont ensuite analysés afin de produire une synthèse, des indicateurs clés et des visualisations.

5. Conclusion

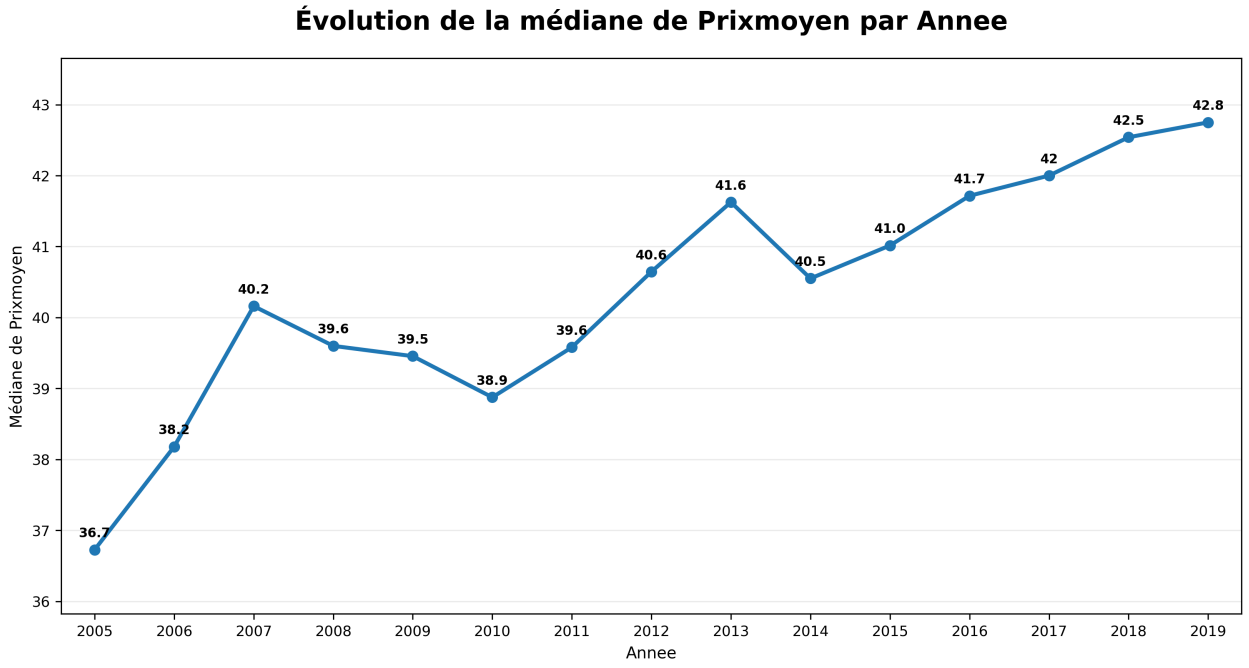

Les résultats présentés dans ce rapport permettent de synthétiser les données retournées par la requête et d'en faciliter l'interprétation à travers des indicateurs et des visualisations adaptés.

6. Aperçu des résultats (15 lignes sur 10000)

Region	Province	Materiau	Annee	PrixMoyen
Béni Mellal-Khénifra	Azilal	33x33 & similraires (m²)	2005	61,18
